BULLETIN R

REFLECTORS AND FIXTURES

—FOR—

INDUSTRIAL LIGHTING

WHEELER "PARA-STEEL" REFLECTORS are made especially for use with Mazda Lamps in the illumination of industrial plants.

They are manufactured in their entirety in a factory which for upwards of thirty years has specialized on reflectors for all purposes of illumination.

The designs are original and have been made with especial reference to the proper position of the Mazda lamp filament in its relation to the reflecting surface, so as to ensure a maximum of efficiency and a light distribution best adapted to the several distinct conditions covering the requirements of industrial operations.

THIS LABEL ON ALL GENUINE

WHEELER

REFLECTORS

WHEELER HOLDER
(Patented)

The **Wheeler Holder**, illustrated above, consists of two essential pieces; viz.:—a **Brass Holder** which springs over the bead on the bottom of a brass shell socket, and a Brass RING which clamps the HOLDER firmly to the socket.

Holders for both the Extensive and the Intensive positions are furnished; designated respectively in this Bulletin by the letters "X" (Extensive) and "N" (Intensive).

Wheeler "X" and "N" Holders are permanently attached to the Reflectors listed with "Holders Attached."

WHEELER "PARA-STEEL" REFLECTORS have been designed to meet four distinct conditions in the illumination of industrial plants, viz.:—

Group "F" (Flat Fluted) Reflectors give a wide light distribution, with some light above the horizontal, for use in factories, mills, machine shops, etc., where some light is needed for the repair, adjustment and oiling of shafting, belts and pulleys placed near the ceiling.

Group "D" (Shallow Dome) Reflectors give a wide light distribution and *no* light above the horizontal, for the General Illumination of factories, mills, machine shops, work benches, presses, sewing tables, and large areas in general.

Group "W" (Wide) Reflectors give a wide light distribution, with all the flux confined within a zone of 75° from the vertical (and the greatest values within 60°), for greater heights—or greater intensities at the plane, than either of the preceding groups, for the General Illumination of factories, textile mills, machine shops, foundries, work benches, sewing rooms and large areas requiring bright illumination.

The Reflectors in this group have a greater efficiency than any other porcelain enameled steel reflectors so far placed on the market.

Group "P" (Parabolic) Reflectors give an Intensive light distribution with deep (or N) holder and Extensive with flat (or X) holders, and are especially adapted to Localized Lighting, where a greater illumination of the plane, within a limited area, is required. These finished in Porcelain Enamel are particularly serviceable in paper mills, chemical works, dye houses, etc., where excessive moisture and chemical fumes will quickly disintegrate painted reflectors.

WHEELER MAZDA FIXTURES consist of Clusters for Mazda lamps operated in Multiple or Series, and of Single Lamp Fixtures, which are assembled from the larger sizes of WHEELER "PARA-STEEL" REFLECTORS with the Standard Fittings shown on page 19. Fixtures for the smaller lamps can be assembled from these fittings and appropriate reflectors as may be required, while Special Designs can be made to order.

The many prominent installations of these reflectors and fixtures that have been made, afford a practical demonstration of their efficiency and substantial construction.
